

## StingRay / MART Disc Oil Skimmer Retrofit

Because commercially available oil skimmers are not reliable in severe operating environments, StingRay engineered and manufactures its own Oil Skimmer Systems. StingRay / MART Skimmers overcome the shortcomings of the commercial units by eliminating disc warpage, and frequent drive motor and bearing failures.

StingRay / MART Oil Skimmers have no-warp polished stainless steel discs, removable stainless steel scrapers blades, High Temperature Totally Sealed TENV Gear Motors for heat and chemical resistance, Pillow Block Bearings on both sides of the Skimmer Disc for stability, and deep Discharge Troughs to prevent spillage. For heavy oil removal, a Heated Trough model is also available. The StingRay / MART oil skimmer can be connected to the 7-day clock to control operating times and allow operation after the solution has cooled and skimming is most effective.

The Replacement Oil Skimmer is a drop in for the old style skimmers taking just a few minutes to install. The easily installed Retrofit Kit Oil Skimmer is for equipment without an existing skimmer. It includes a Skimmer reservoir to be welded to the Cabinet Reservoir, Box Lid, and complete installation instructions.
